

# Homework 1: Introduction to Differential Equations

MATH 238: Differential Equations

Name: Brendan Tea

Date: January 6, 2026

**Instructions:** You have received a latex document. Write your answer in this document. Write your name and date in the space provided. Show all your work and clearly justify your answers. Recompile your work. This assignment is intended to introduce the basic ideas and language of differential equations and allow you to practice writing in Latex.

## Problems

### 1. What is a Differential Equation?

Which of the following equations are differential equations? Explain your reasoning.

(a)  $y = 3x^2 + 1$

(b)  $\frac{dy}{dx} = 5x^4$

(c)  $\frac{d^2y}{dx^2} + y = 0$

(d)  $x^2 + y^2 = 9$

**SOLUTION:** b & d are differential equations because definition of a differential equation.

“An equation containing the derivatives of one or more unknown functions (or dependent variables), with respect to one or more independent variables, is said to be a differential equation (DE).” (Zill 2024, p. 3)

Namely, as you can see in A & D, there are no derivatives in general. Thus, A & D are not differential equations. B is a differential equation because it has a first derivative with an unknown function  $y(x)$  that is respect to one of the independent variables  $x$ . C is a differential equation because it has a second derivative with an unknown function  $y(x)$  that is repsect to one of the variables  $x$ .

### 2. Order of a Differential Equation

Determine the order of each differential equation below. Explain.

(a)  $\frac{dy}{dx} = \sin x$

(b)  $\frac{d^2y}{dx^2} - 4\frac{dy}{dx} + y = 0$

(c)  $\left(\frac{d^3y}{dx^3}\right)^2 + y = 1$

**SOLUTION:** We simply take the highest order of the derivative from each equation.

- (a) Order 1,  $\frac{dy}{dx}$
- (b) Order 2,  $\frac{d^2y}{dx^2}$
- (c) Order 3,  $\frac{d^3y}{dx^3}$

### 3. Linear vs. Nonlinear

State whether each differential equation is **linear or nonlinear**. Justify your response.

- (a)  $\frac{dy}{dx} + 2y = e^x$
- (b)  $\frac{dy}{dx} = y^2$
- (c)  $x^2 \frac{d^2y}{dx^2} + y = 0$

**SOLUTION:** We use the definition of a linear differential equation.

“An  $n$ th-order ordinary differential equation  $F(x, y, y', \dots, y^{(n)}) = 0$  is said to be **linear** if  $F$  is linear in  $y, y', \dots, y^{(n)}$ . This means that an  $n$ th-order ODE is linear when  $F(x, y, y', \dots, y^{(n)}) = 0$  is the following. ” (Zill 2024, p. 5)

$$a_n(x) \frac{d^n y}{dx^n} + a_{n-1}(x) \frac{d^{n-1} y}{dx^{n-1}} + \dots + a_1(x) \frac{dy}{dx} + a_0(x)y - g(x) = 0 \quad (1)$$

- (a) Linear, All derivatives don't have any powers and coefficients are dependent to  $x$ .
- (b) Nonlinear, The 0th derivative has a power not equal to 1, thus it is a nonlinear DE.
- (c) Linear, All derivatives don't have any powers and coefficients are dependent to  $x$

### 4. Checking a Solution

Verify whether the given function is a solution of the differential equation.

- (a) Check whether  $y = x^2$  is a solution of

$$\frac{dy}{dx} = 2x$$

- (b) Check whether  $y = e^{-2x}$  is a solution of

$$\frac{dy}{dx} + 2y = 0$$

**SOLUTION:** The process is to check the left hand side is equal to the right hand side.

$$(a) \quad y = x^2$$

$$\frac{dy}{dx} = \frac{d}{dx}x^2$$

$$\implies \frac{dy}{dx} = 2x$$

$$\therefore \boxed{y = x^2 \text{ is a solution.}}$$

$$(b) \quad y = e^{-2x}$$

$$\frac{dy}{dx} = \frac{d}{dx}e^{-2x}$$

$$\frac{dy}{dx} = -2e^{-2x}$$

$$\frac{dy}{dx} + 2y = -2e^{-2x} + 2y$$

$$\frac{dy}{dx} + 2y = -2e^{-2x} + 2(e^{-2x})$$

$$\implies \frac{dy}{dx} + 2y = 0$$

$$\therefore \boxed{y = e^{-2x} \text{ is a solution.}}$$

## 5. Verifying solutions

Verify that the given function is a solution to the given differential equation.

$$(a) \quad \frac{dy}{dx} + 4xy = 8x^3, \quad y = 2x^2 - 1 + c_1e^{-2x^2}$$

$$(b) \quad x^2 \frac{dy}{dx} + xy = 10\sin x, \quad y = \frac{5}{x} + \frac{10}{x} \int_1^x \frac{\sin t}{t} dt$$

**SOLUTION:**

## 6. General vs. Particular Solutions

(a) Explain the difference between a **general solution** and a **particular solution** of a differential equation.

(b) Identify which of the following is a general solution:

$$y = Ce^{3x}, \quad y = 5e^{3x}$$

## 7. Initial Value Problem

Consider the differential equation

$$\frac{dy}{dx} = 3x^2$$

(a) Find the general solution.

(b) Find the particular solution that satisfies  $y(0) = 4$ .

**SOLUTION:**

## 8. Modeling with Differential Equations

Suppose that the rate of change of a population  $P(t)$  is proportional to the size of the population.

- (a) Write a differential equation that models this situation.
- (b) Identify the dependent and independent variables.

**SOLUTION:**

## 9. Slope Fields (Conceptual)

Without solving, describe what information a slope field provides about solutions to a differential equation.

**SOLUTION:**
